

Motorcycle

Bikes were first fitted with engines in the 19th century and have never looked back! Today, millions enjoy the fast, convenient travel and the freedom of the open road or trail that motorcycles provide. This **Yamaha XJR 1300** is called a “naked” bike, because its engine is not hidden behind body panels. With a top speed of 130 mph (210 km/h), it is faster than many cars.

Chassis › The frame to which other parts of the motorcycle are attached, the chassis helps keep the wheels in line for good handling. It is usually made of steel or a combination of metals (alloy).

Rear seat › Big motorcycles have a seat long enough for a passenger, who can grip the handle behind the seat.

Indicator light

Shock absorber ›

A coil-spring and oil-filled cylinder cushion the bike and rider over bumps in the road.

Rear wheel ›

This is driven by power from the engine through a shaft or belt, or on this motorcycle, a metal chain similar to a bicycle chain.

Exhaust pipe › The exhaust pipe channels waste gases from the engine out behind the bike.
