

Cor Caroli
75 Suns

La Superba
608 Suns

Ursa Major

La Superba (Y Canum Venaticorum)
Notable for its deep red color as seen through binoculars and small telescopes, this red giant varies between 5th and 7th magnitudes every five months or so

M51
The face-on spiral galaxy M51 is visible through binoculars and small telescopes. Larger instruments show that it is interacting with a smaller companion, NGC 5195

M63
Lying 30 million light-years away (similar to the distance of M51), this beautiful spiral is popularly termed the Sunflower Galaxy

M3
This globular cluster is easily seen with binoculars and small telescopes, appearing about half the width of the full Moon

Cor Caroli (α Canum Venaticorum)
The two bodies that make up this wide double star of 3rd and 6th magnitudes are easily separated by small telescopes

▷ **Star distances**
Canes Venatici contains numerous celestial objects of interest, but the constellation figure is made up of only two pattern stars. The brighter of the two, Cor Caroli, lies more than four times farther than the fainter Beta Canum Venaticorum.
