

△ NGC 7331
A spiral galaxy seen edge-on from Earth, NGC 7331 is often used as an example of how our Milky Way galaxy might look from the outside.

M15
One of the densest known globular clusters, M15 is also one of the finest of the northern sky and easily spotted through binoculars

Enif (ε Pegasi)
From the Arabic for "nose," the bright star Enif marks the horse's nose and is easily visible with the naked eye

EQUULEUS

THE FOAL

THE SECOND-SMALLEST CONSTELLATION AND WITH NO BRIGHT STARS, EQUULEUS DEPICTS A FOAL'S HEAD LYING NEXT TO THE LARGER HEAD OF PEGASUS.

Equuleus has been a companion to Pegasus in the sky since ancient times. One Greek myth suggests it could be Celeris, the offspring or brother of the winged horse. It is a faint constellation that is easily overlooked. The double star Gamma Equulei has components that are readily separated with binoculars.

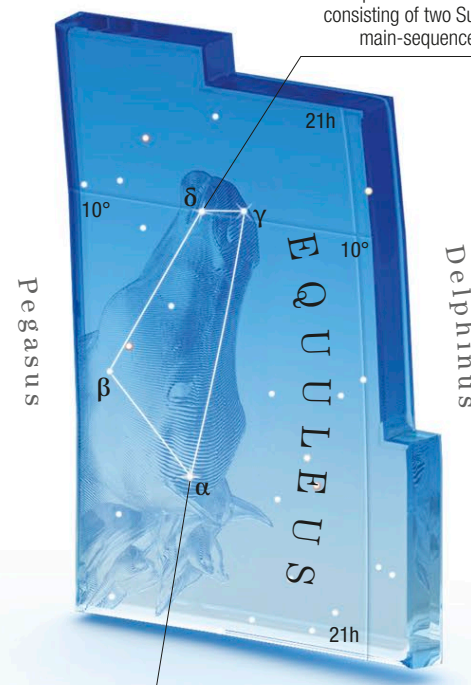

KEY DATA

Size ranking	87
Brightest stars	Kitalpha (α) 3.9, Delta (δ) 4.4
Genitive	Equulei
Abbreviation	Equ
Highest in sky at 10pm	September
Fully visible	90°N–77°S

CHART 3

Delta (δ) Equulei
The second-brightest star in the constellation, Delta Equulei is a binary star consisting of two Sun-like main-sequence stars

Kitalpha (α Equulei)
A yellow giant, 190 light-years distant and 75 times more luminous than the Sun; its name comes from the Arabic for "piece of horse"
