

Delta Hydrae
46 Suns

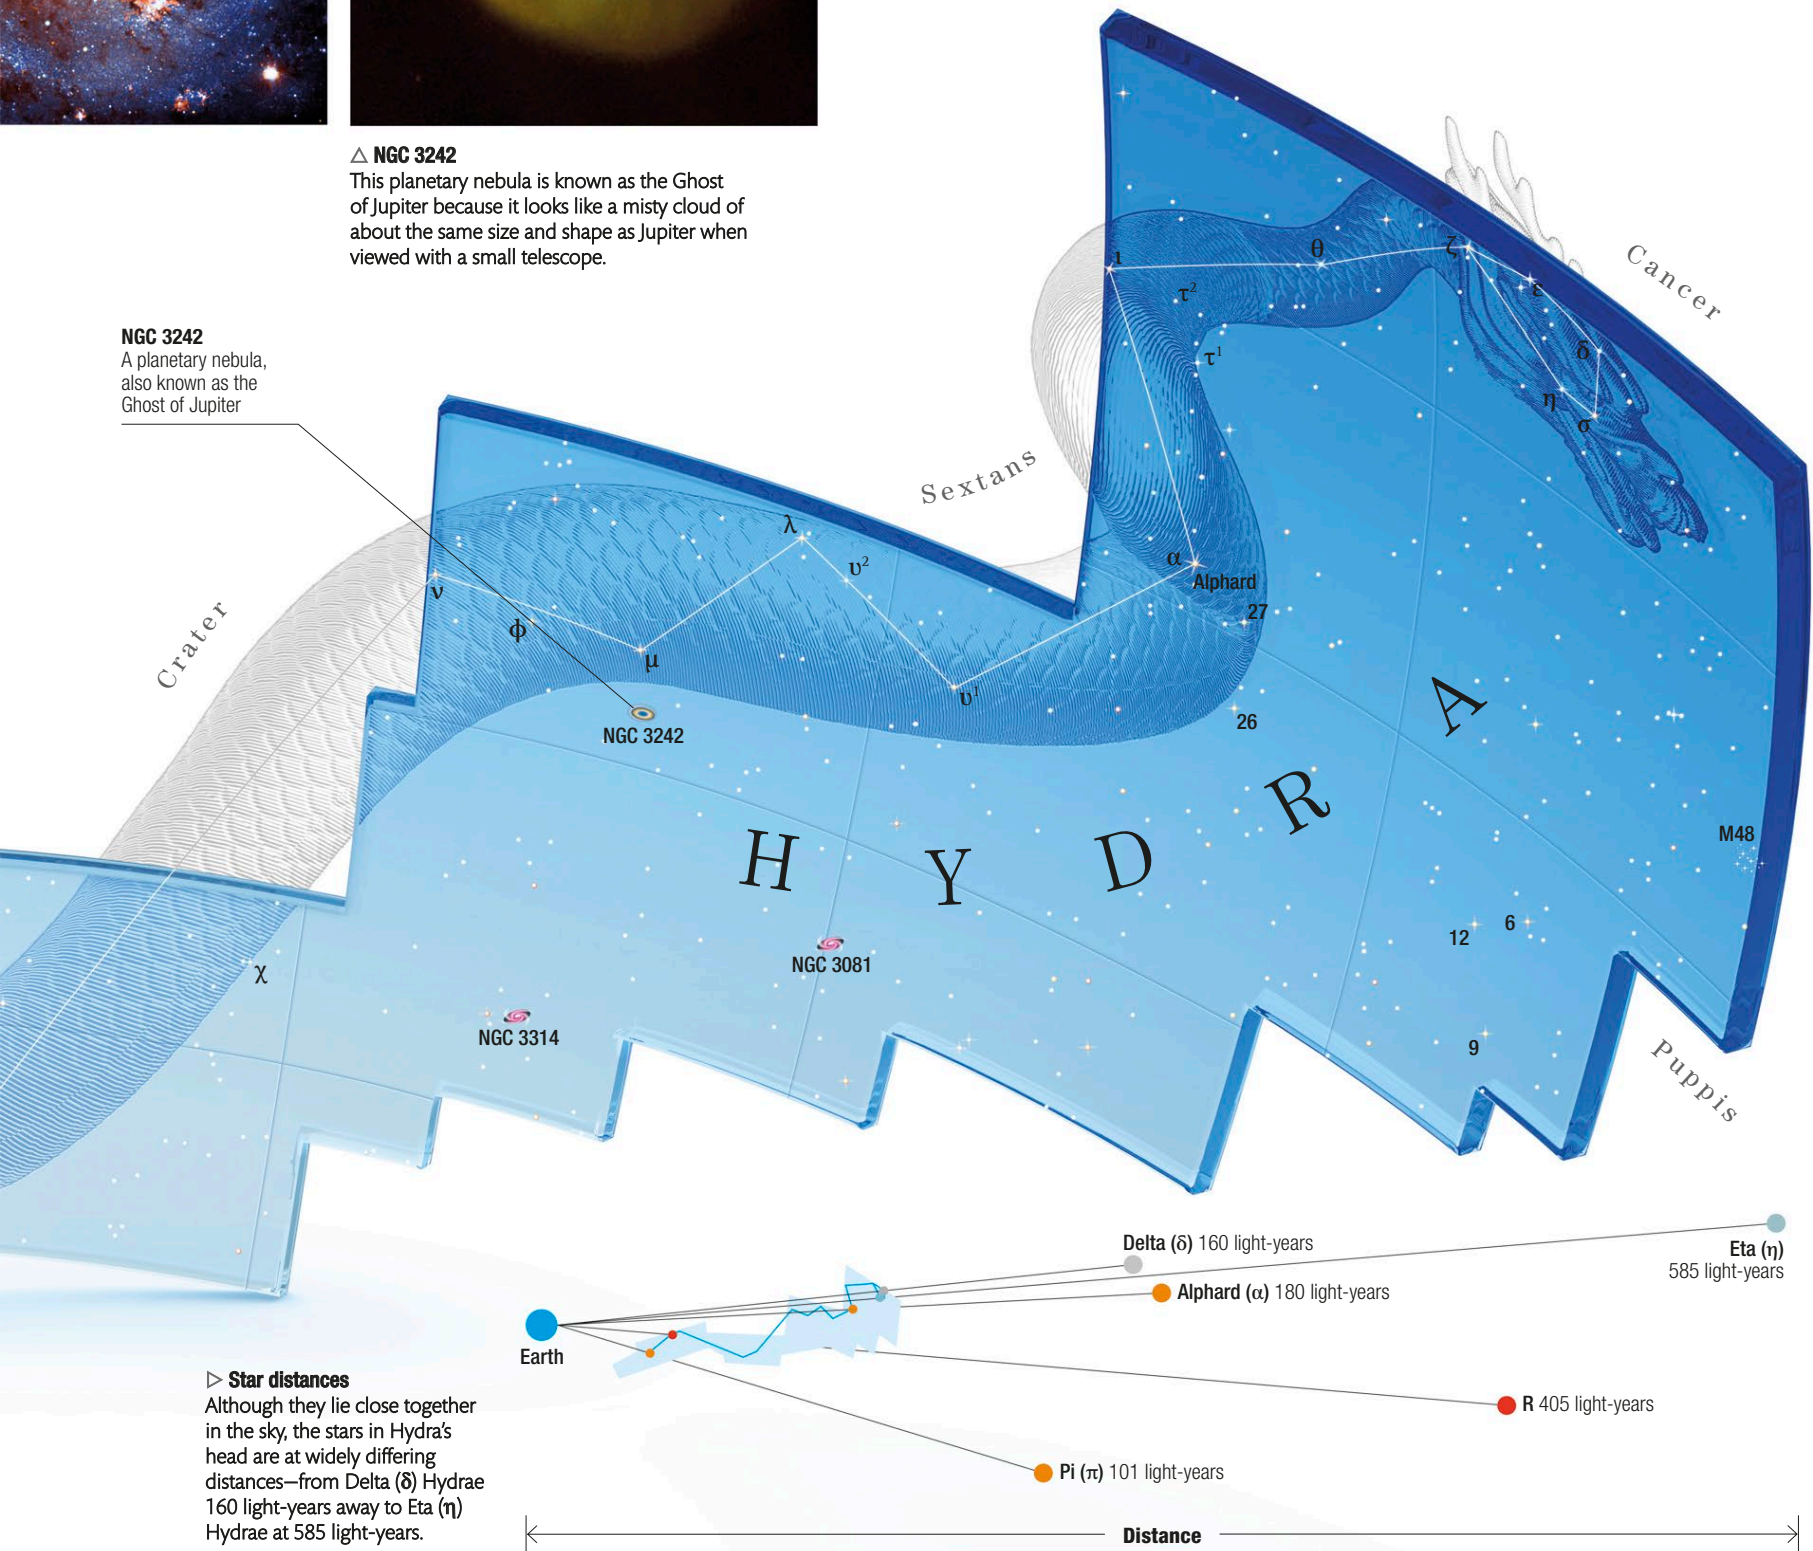

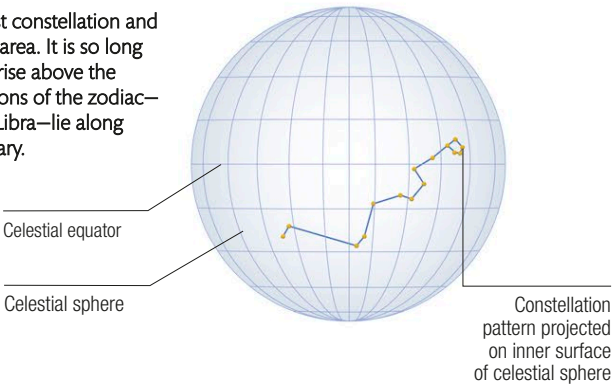

△ NGC 3242
This planetary nebula is known as the Ghost of Jupiter because it looks like a misty cloud of about the same size and shape as Jupiter when viewed with a small telescope.

NGC 3242
A planetary nebula, also known as the Ghost of Jupiter

Epsilon Hydrae
61 Suns

Alphard
425 Suns

▷ Hydra's size
Hydra is both the longest constellation and the largest measured by area. It is so long that it takes six hours to rise above the horizon. Four constellations of the zodiac—Cancer, Leo, Virgo, and Libra—lie along Hydra's northern boundary.

▷ Star distances
Although they lie close together in the sky, the stars in Hydra's head are at widely differing distances—from Delta (δ) Hydrae 160 light-years away to Eta (η) Hydrae at 585 light-years.
