

△ Across the electromagnetic spectrum
The visible light spectrum covers only a narrow range of wavelengths, between about 390 and 700 nanometers (billionths of a meter). Wavelengths shorter than the blue end of the spectrum include ultraviolet, X-rays, and gamma rays, while those longer than red include infrared and radio waves (including microwaves). Only visible light and some radio waves reach Earth's surface; most other waves are blocked at various levels in the atmosphere.
