

Luminosity scale

Major constellations include a scale that shows the luminosity (the total energy emitted, in multiple's of our Sun's energy) of key stars, including the least and most luminous of the constellation's pattern stars.

Constellation locator charts

Each constellation includes a locator chart in the data panel that shows where the constellation lies on the celestial sphere. The locator charts are numbered to correspond to the large charts on these introductory pages.

CHART 1

CHART 5

Greek alphabet

The constellation charts use letters of the Greek alphabet to identify bright stars, according to the commonly used system originally invented by the German astronomer Johann Bayer.

Alpha	α	Eta	η	Nu	ν	Tau	τ
Beta	β	Theta	θ	Xi	ξ	Upsilon	υ
Gamma	γ	Iota	ι	Omicron	ο	Phi	φ
Delta	δ	Kappa	κ	Pi	π	Chi	χ
Epsilon	ε	Lambda	λ	Rho	ρ	Psi	ψ
Zeta	ζ	Mu	μ	Sigma	σ	Omega	ω

CHART 2
SOUTH POLAR SKY

Centered on the south celestial pole, this chart shows the constellations of the south polar sky. It covers the area from declination -90° at the pole, northward to declination -50°. The sky around the pole is lacking in bright stars, and no one star is close enough to identify the pole's position. Stars in the area around the pole are circumpolar for observers in the Southern Hemisphere; they remain visible in the night sky, never setting below the horizon. The farther south the observer is located, the greater the amount of sky that is circumpolar.
