

TYPES OF SAVANNA

There are several types of African savanna vegetation, mainly influenced by the amount of rainfall, which varies with distance from the equator. Rain in the Serengeti falls in two main seasons: from March to May and November to December. In the more wooded northwestern Serengeti, the average annual rainfall is 41 in (1,050 mm), while in the grass-dominated open savannas of the southeast, it is just 22 in (550 mm).

The **largest numbers** of **grazing and browsing animals** in the **African continent** are found in the Serengeti
