The Gates Glacier

A tributary of the Kennicott Glacier, the Gates Glacier is 8 miles (13 km) long.

**△ WINDING TRAILS**

This view of a middle section of the Kennicott Glacier shows its well-developed medial moraines (dark stripes containing rock debris). Some of these are more than 1,150 ft (350 m) wide.

Donoho Peak provides excellent views from its summit at 6,696 ft (2,041 m)

The Root Glacier

This 14-mile- (22-km-) long tributary consists of relatively clean, rock-free ice.

◁ MELTWATER CHANNEL

The surface of both the Kennicott Glacier and its tributary, the Root Glacier, feature numerous turquoise meltwater channels that snake across the surface.

(old mining camp)

Meltwater pools

The glacier's terminus, or snout, which consists of a gray-colored slush, is surrounded by meltwater pools.

Snout edge

Over the past several decades, the snout edge has retreated markedly, leaving mounds of moraine behind.

▷ BLUEST BLUE

Some meltwater pools on the glacier's surface are more than 20 ft (6 m) deep and an exceptionally vivid blue. The blueness is due to the depth and purity of the water, which absorbs all other light wavelengths.

Kennicott River
