

The Solar System

The Solar System is made up of our nearest star, the Sun, and everything that orbits, or travels around, it. This include planets, moons, comets, asteroids, smaller rocks, and dust.

Our star

The Sun is a medium-sized star. The Sun's powerful force of gravity pulls on the planets, keeping them in orbit around it.

The Sun is a kind of star that scientists call a yellow dwarf.

Mercury is the smallest planet in the Solar System. It's a little bigger than our Moon.

People have invented ways to study and travel around our Solar System.

Earth is the only planet that we know for sure has life on it.

Mars is known as the "Red Planet" as its dusty surface contains rust.

Venus has thousands of volcanoes on its surface.

Many spacecraft have visited Mars to study its weather, surface, and rocks.

Scientists think the asteroid belt contains the leftover rocks from when the planets were formed.
