

Total solar eclipse

A total solar eclipse occurs when the Moon passes in front of the Sun and covers its face perfectly. This blocks out most of the light, making it appear as if it is night-time.

Solar prominences

Huge eruptions from the Sun's surface are called solar prominences. They form loops due to the Sun's invisible magnetic field.

Some sunshine is good for us. We need it to make vitamin D, which helps our bones stay healthy.

8 minutes

Lightning speed

Light travels really fast, but it still takes time to get to us on Earth. A light year is the distance a beam of light would travel in one year.

It takes eight minutes for the Sun's light to reach Earth.

Solar panels

Life on Earth

Animals and plants depend on energy from the Sun to survive. Technology, such as solar panels, has been developed to absorb the Sun's energy and turn it into electricity.
