

Earth is our home and the only planet known to contain life. It is just the right distance from the Sun for plants and animals to survive.

Sun rays

The middle of the planet, the equator, gets a fairly constant amount of direct sunshine.

Earth The

Summer happens in the northern half of the world when that part is tilted towards the Sun.

Countries near the equator have a wet and a dry season, rather than spring, summer, autumn, and winter.

Seasons

We have different seasons on Earth because the planet is slightly tilted. This means that at different times of the year different parts of the planet are closer to the Sun.

Earth's axis is tilted at an angle of 23.5° .
