

Rain and snow

When a cloud holds enough water droplets or ice crystals, it makes rain or snow. This water falls back to Earth.

Winter sports such as skiing rely on a good amount of snowfall!

Rainwater is almost pure water, except where it has been polluted by fumes from vehicles and factories.

Dams are built to break the flow of rivers. We do this to create lakes, generate electricity, or prevent floods.

Back to the sea

Rainwater flows over and under the Earth, slowly making its way back to the oceans. The water picks up minerals on its journey.

Groundwater is water in the soil or rocks in the ground. It may flow in underground rivers.
