

Volcanoes

Volcanoes are openings in the ground where hot, melted rock, called magma, escapes from deep underground. It's best not to be near a volcano when it's erupting!

Scientists take measurements of changes in the volcano's shape, vibrations, and gases to try to predict when the next eruption might be.

When magma flows out of a volcano it is called lava.

A thermometer measures lava temperature, which gets as hot as 700-1,300°C (1,300-2,400°F)!

Lava can ooze from cracks in the sides of a volcano.

The main vent is the biggest opening for magma to escape.

A magma chamber is a pool of hot, melted rock.
