

Fish

Fish live in water, breathe in oxygen using gills, and are cold-blooded. They have fins to help them swim.

Reptiles

Reptiles have scaly skin and are cold-blooded. Most lay eggs. Apart from snakes, almost all other types of reptile have four legs.

Cold-blooded animals sunbathe to warm up their bodies.

Birds

Birds have feathers, wings, and a hollow skeleton. Most can fly, but some, such as penguins, cannot. Birds lay eggs and are warm-blooded.

Amphibians

Amphibians, such as frogs and newts, live in water and on land. They are cold-blooded and have moist skin.

Mammals

Mammals have hair and are warm-blooded. They give birth to live babies, which they feed with milk. You are a mammal!

Vertebrates

These animals have a backbone and a skull. A strong skeleton inside their bodies lets them grow larger than invertebrates.

Animals

There are millions of different types of animal in the world. Scientists divide them into two groups – vertebrates and invertebrates. However, all animals have things in common, such as breathing air, moving around to find food, and sensing the world.

Less than 5% of all the different types of animal are vertebrates. There are many, many more types of invertebrate.
