

Plant plankton
rely on the Sun
for energy.

Arctic cod

These fish are a food source for many marine animals. Arctic cod eat plankton, shrimp, marine worms, and sometimes even each other!

Some plankton are so small they can't be seen with the naked eye.

Plankton

Tiny drifting animals and plants called plankton are eaten by Arctic cod and coldwater shrimp.

Ringed seal

This meat-eating animal eats fish, shrimp, and plankton, but is hunted and eaten by polar bears and killer whales.

Coldwater shrimp

Coldwater shrimp live near the ocean floor and mostly eat plankton. They make a tasty snack for seals.

Draw your own

To draw your own food web, start by choosing a habitat, such as a forest or a desert. Now think about what the animals in that habitat eat and show how they link together.
