

A greener future

Scientists and engineers now look for ways to make energy that do not burn fossil fuels. They are especially interested in energy sources that won't ever run out, such as wind and sunlight.

Solar panels

Solar panels absorb sunlight to make electricity and heat.

Electric cars

These cars run on rechargeable batteries, rather than petrol. Because of this, they don't pollute the air with CO₂ and other harmful gases.

Trees

Planting trees helps to fight climate change because plants absorb CO₂ from the air. They use the carbon to make their own food and grow.

Every tree makes a difference. This little one could live for 200 years!

Effects of climate change

A warmer climate can lead to extreme weather. Big storms are becoming more common, often causing flooding. Climate change is also melting the sea ice covering the Arctic Ocean.

Flooding

Melting Arctic sea ice

Wind farms

Wind turbines make electricity from wind power rather than by burning fossil fuels. Groups of turbines are called wind farms.
