

A human eye contains more than 125 million receptors.

Pain

We have receptors in our bodies that let us feel pain.

Heat

Receptors in the skin let us feel heat.

Other senses

There are many other kinds of receptor in our bodies, checking what's happening outside and inside us.

Needing the toilet

Receptors deeper inside our bodies let us know when it's time to go to the toilet.

Hearing

Sounds travel into the ears and are sensed by receptors in the inner ears, inside our head. The inner ears also give us our sense of balance.

Echolocation

Bats have a special sense called echolocation, which they use to catch flying insects at night. They make calls and listen for echoes as the calls bounce off the insects. This tells the bats exactly where the insects are. In a similar way, submarines use technology called SONAR to find other objects under the sea.
