

Building bridges

Bridges are designed by engineers to get us from one place to another as quickly as possible. They can cross canyons, rivers, roads, and train tracks.

Cantilever

A cantilever is a structure that is only supported at one end. To create a cantilever bridge, lots of these structures are joined together.

The cables can make interesting patterns.

Cable-stayed

A cable-stayed bridge has one or two towers. Cables fan directly down from these towers to the bridge base, holding it up.

Suspension bridges can span great distances.

Suspension

In a suspension bridge, steel wires connect two tall towers that are sunk deep into the ground. The crossing hangs from these towers.

Log bridge

A log bridge is the most ancient form of bridge. It is made from trees that have fallen or are cut down on purpose.
