

NERVOUS SYSTEM

The **nervous system** is a control network that connects all body systems. It is split into the central and peripheral nervous systems (PNS). The PNS is comprised of the somatic and autonomic nervous systems.

SYSTEM OVERVIEW

The somatic nervous system consists of nerves carrying sensory and motor signals to and from the spinal cord and brain. The autonomic nervous system (ANS) is divided into two functional systems: the sympathetic nervous system and parasympathetic nervous system, which accounts for many of yoga's benefits.

Spinal cord

In this superior, or bird's-eye, view of a vertebra, you can see how your spinal cord is protected by the bony encasement of the spinal column. Spinal nerves project off to the side, in between the vertebrae.
