

HOW WE BREATHE

When you inhale, the breath enters your nose, throat, and then your lungs. Your lungs and ribcage expand three-dimensionally in all directions; your diaphragm engages to flatten. When you exhale, your diaphragm relaxes to ascend, your lungs and ribcage compress, and the air releases out of your throat and then nose.

Belly breathing

"Belly breathing" doesn't mean you are actually breathing in your belly, but rather that you are allowing your belly to move freely with your breath. When your diaphragm engages with the inhale, it presses against your abdominal organs—pushing down and out, which is why this is also called diaphragmatic breathing.
