

Neck

Your **splenius capitis** and **splenius cervicis** engage to press your head back, perhaps in slight cervical extension to counteract the tendency of the head to fall forward.

Bottom arm

Your **anterior deltoid**, **subscapularis**, **teres major**, **pectoralis major**, and **latissimus dorsi** internally rotate your shoulder. Your **posterior deltoid** stretches while in internal rotation. Your **elbow flexors** engage while your **triceps brachii** stretches.

Thighs

Your **hip flexors** help stabilize your hips in flexion, while your **quadriceps** and **gluteus medius**, **minimus**, and **maximus** stretch.
