

Maple

Mmm! Porridge and pancakes taste delicious with maple syrup. In Canada and the northeast USA, sugar maple trees grow. In early spring, when the nights are still cold, a tube is pushed into the trunks of these trees. Out flows a golden liquid called sap. This is boiled to make sweet syrup. Canada is famous for its maple trees and there is even a maple leaf on the country's flag.

In autumn, maple trees drop their leaves. Before this happens, they change colour, and they can turn whole mountains yellow, orange, and red. The chemicals that produce this amazing display are the same ones that give carrots, egg yolks, and cherries their colour.
