

Dandelion

*Each dandelion
seedhead has 100-150
fluffy seeds.*

To gardeners, they are weeds, but to insects, they are lunch. Dandelions make nectar that butterflies, bees, and other insects love. So we should think before we dig up these yellow flowers that shine like little suns in the grass.

After flowering, a dandelion head turns into a fuzzy ball of fluff. Each seed becomes a miniature parachute. When the wind blows, the light seeds are carried away, drifting until they land on a patch of soil where they can grow into a new dandelion. Some people play a game with these fluffy baubles. They count how many breaths it takes to blow all the seeds off them — this is supposed to tell the time. Some people call them “dandelion clocks”.
