

The image features two long-eared myotis bats in flight against a light blue background speckled with white stars and constellations. The bat in the upper left is shown from a front-facing perspective with its wings spread wide, revealing the intricate structure of the wing membranes. It has a light tan face and chest, with dark brown fur on its wings and back. Its mouth is open, showing a pink interior. The bat in the lower right is also shown from a front-facing perspective, with its wings spread. It has a similar coloration to the first bat. The background is a soft, light blue with numerous small white stars and larger, faint white constellations. In the bottom right corner, there are some white, stylized line drawings of plant-like structures.

Long-eared myotis,
Western North America

*Bats are like furry weather
forecasters – they sense tiny
changes in air pressure
that tell them what the
weather will be like.*
