

Growing algae

Algae are a type of organism similar to plants, shown here growing in a lab. On a large scale, they are grown in a machine called a photobioreactor, which supplies the algae with the right amount of sunlight and carbon dioxide to help them produce oil at a faster rate.

BIODIESEL BUS

DeuSEL®—the world's first biodiesel, made from the microalgae *Euglena*—powers this bus in Yokohama, Japan. The DeuSEL® project aims to develop alternative fuels that reduce carbon dioxide emissions.
