

CONTROLLING FLIGHT

Here, hot air balloons float over the Turkish landscape at dawn. Hot air balloons often take off at sunrise or sunset, because during these times, the air temperature is cooler, making it easier to take off.

Preparing to fly

This balloon is being filled with hot air as it is prepared for flight in Cappadocia, Turkey. Cylinders containing a gas called propane are attached to jets that point into the balloon. When the gas burns, it generates lots of heat, which fills up the balloon with hot air to lift it off the ground.
