

By the way...
 I thought that dynamite
 would end war. I believed
 that when people saw
 its destructive power,
 they would be afraid
 to attack each other.

The environmentalist
 Wangari Maathai was
 the first African
 woman to receive
 the Nobel Prize.

The road to peace

In 1888, Nobel got a shock when he saw his **obituary in a newspaper**. It called him the “merchant of death.” In fact, his brother, Ludvig, had died, but they had published Alfred’s obituary by mistake. Alfred didn’t want to be remembered like this, so, when he really did die, he **left most of his fortune** to set up a prize that would celebrate great achievements in peace and learning. This became known as the **NOBEL PRIZE**.

Dynamite has been
 used in blast mining
 and to build canals,
 railways, and roads.

Alfred’s little brother was killed in an explosion when an experiment went wrong

A Nobel pursuit
 The first Nobel Prizes in Physics, Chemistry, Physiology (or Medicine), Literature, and Peace were awarded in 1901. Since then, the prize has become the greatest award for achievement in the world. It contributes to the progress of science and culture, and the promotion of peace... all because a newspaper made a mistake.

He paved
 the way for...

Many big engineering projects, like the **HOOVER DAM** in the United States (constructed between 1931 and 1936) were only possible because of the **BLASTING POWER** of dynamite.
