

Congruent triangles

TRIANGLES THAT ARE EXACTLY THE SAME SHAPE AND SIZE.

Identical triangles

Two or more triangles are congruent if their sides are the same length and their corresponding interior angles are the same size. In addition to sides and angles, all other properties of congruent triangles are the same, for example, area. Like other shapes, congruent triangles can be translated, rotated, and reflected, so they may appear different, even though they remain the same size and have identical angles.

$\triangle$ Congruent triangles

The triangle on the right is how the triangle on the left would appear if rotated clockwise through 180° and reflected.
