

vertex
a point where edges meet

face
a surface of the solid
bordered by edges

length
distance of longest side

△ Faces

A face is the surface contained between a number of edges. This prism has seven faces.

△ Vertices

A vertex (plural vertices) is a point at which two or more edges meet.

△ Edges

An edge is a straight line where two surfaces of a solid meet. This prism has 15 edges.

Other solids

A solid with only flat surfaces is called a polyhedron and a solid with a curved surface is called a nonpolyhedron. Each common solid also has a name of its own.

▷ Cylinder

A cylinder is a prism with two circular ends joined by a curved surface.

this face is equal in size to its opposite

▷ Rectangular prism

A rectangular prism is a prism whose opposite faces are equal. If all its edges are equal in length, it is a cube.

▷ Sphere

A sphere is a round solid in which the surface is always the same distance from its center.

vertex

▷ Pyramid

A pyramid has a polygon as its base and triangular faces that meet at a vertex (point).

apex

▷ Cone

A cone is a solid with a circular base that is connected by a curved surface to its apex (highest point).
