

Different types of bar graph

There are several different ways of presenting information in a bar graph. The bars may be drawn horizontally, as three-dimensional blocks, or in groups of two. In every type, the size of the bar shows the size (frequency) of each group of data.

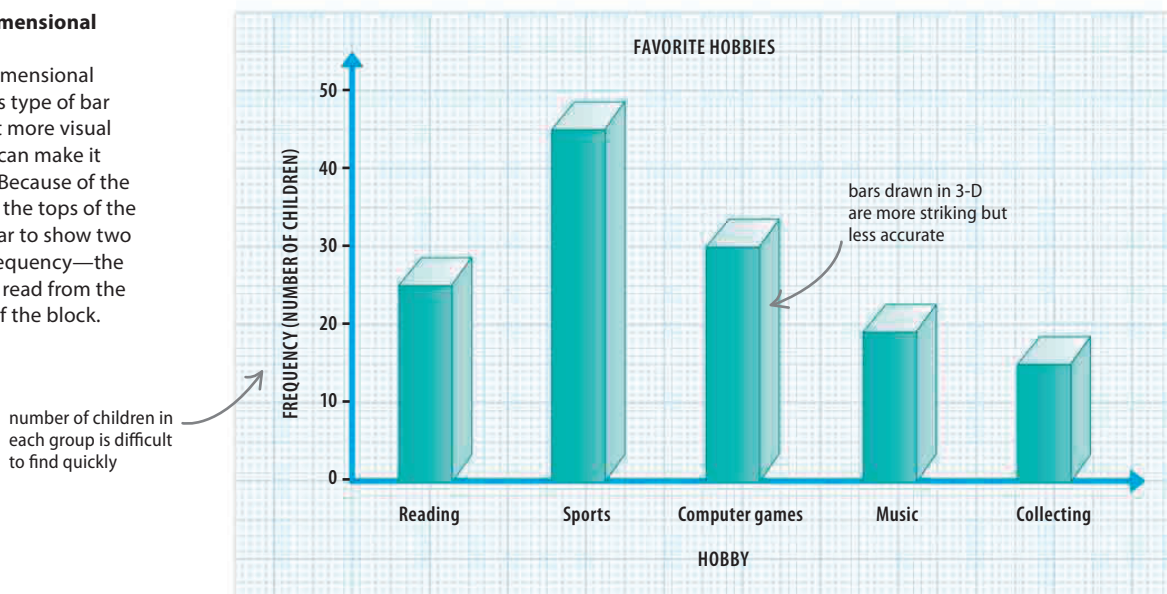

▷ Horizontal bar graph

In a horizontal bar graph, the bars are drawn horizontally rather than vertically. Values for the number of children in each group, the frequency, can be read on the horizontal x axis.

▷ Three-dimensional bar graph

The three-dimensional blocks in this type of bar graph give it more visual impact, but can make it misleading. Because of the perspective, the tops of the blocks appear to show two values for frequency—the true value is read from the front edge of the block.

◁ Table of data

This data table shows the results of a survey in which a number of children were asked about their hobbies.
