

Interpreting line graphs

This graph shows temperature changes over a 24-hour period. The temperature at any time of the day can be found by locating that time on the x axis, reading up to the line, and then across to the y axis.

Cumulative frequency graphs

A cumulative frequency diagram is a type of line graph that shows how often each value occurs in a group of data. Joining the points of a cumulative frequency graph with straight lines usually creates an "S" shape, and the curve of the S shows which values occur most frequently within the set of data.
