

$$\text{Average (mean)} = \frac{\text{Sum total of values}}{\text{Number of values}}$$

◁ Calculating the mean

Use this formula to find the average (or mean) for each period of four quarters.

Average for quarters 2–5

Calculate the mean of the figures for quarters 2–5 and mark it at the quarters' midpoint.

$$3.75 + 4.25 + 2.5 + 1.5 = 12$$

$$\frac{12}{4} = 3$$

sum of sales figures for quarters 2–5
mean value
number of values

Average for quarters 3–6

Calculate the mean of the figures for quarters 3–6 and mark it at the quarters' midpoint.

$$4.25 + 2.5 + 1.5 + 4.75 = 13$$

$$\frac{13}{4} = 3.25$$

sum of sales figures for quarters 3–6
mean value
number of values

Average for quarters 4–7

Calculate the mean of the figures for quarters 4–7 and mark it at the quarters' midpoint.

$$2.5 + 1.5 + 4.75 + 5 = 13.75$$

$$\frac{13.75}{4} = 3.44$$

sum of sales figures for quarters 4–7
mean value (rounded to 2 decimal places)
number of values

Average for quarters 5–8

Find the mean for quarters 5–8, mark it on the graph, and join all of the marks.

$$1.5 + 4.75 + 5 + 2.75 = 14$$

$$\frac{14}{4} = 3.5$$

sum of sales figures for quarters 5–8
mean value
number of values
