

Types of angle

There are four important types of angle, which are shown below. They are named according to their size.

Naming angles

Angles can have individual names and names that reflect a shared relationship.

Angles on a straight line

The angles on a straight line make up a half turn, so they add up to 180° . In this example, four adjacent angles add up to the 180° of a straight line.

$$a + b + c + d = 180^\circ$$

$$20^\circ + 40^\circ + 90^\circ + 30^\circ = 180^\circ$$

Angles at a point

The angles surrounding a point, or vertex, make up a whole turn, so they add up to 360° . In this example, five adjacent angles at the same point add up to the 360° of a complete circle.

$$a + b + c + d + e = 360^\circ$$

$$60^\circ + 70^\circ + 90^\circ + 60^\circ + 80^\circ = 360^\circ$$
