

Ice dragons burrow into the ice to create circular cavities, which they line with soft snow to lay their eggs in.

Forest dragons access their nests through hollows in tree trunks. The nests are built deep inside the tree's roots. The dragons line their nest with discarded feathers.

Weather dragons lay their eggs in the clouds. When their young hatch, they travel to the ground in raindrops, which they drink once they land.

Underworld dragons use their toxic breath to blast holes out of the underworld's rock to nest in.

Fire dragons build nests in lava-filled tunnels deep beneath the Earth's crust.
