

Get to know me

As an epiphyte, I get my moisture and nutrients from the air, so you will often see my aerial roots growing above the soil as well as below. Please don't cut off or bury these wandering roots! I am often sold in a clear pot, which I prefer since my roots are attracted to light and help perform photosynthesis.

My flowers are long-lasting

I can flower at any time of the year, sometimes up to three times, and my blooms can stick around for three months or more. Once I have finished flowering, cut back the stem to the biggest bud and I might give you another flush of flowers.

Let's make babies

Sometimes I will grow little babies at my base or along my stem, which will develop and grow their own roots. These are called *keikis*, and once they have several roots, you can remove them and pot them up to flourish in their own containers.
