

HEARTLEAF PHILODENDRON

Philodendron cordatum

This flexible plant will do well in most households. You can either display it as an indoor climbing plant or leave it cascading for an elegant and calming effect. Its immensely pretty heart-shaped leaves are also air-purifying.

“I am versatile—I can both climb and trail.”

Help me thrive

POSITION

Give plenty of growing space in a part-shaded position out of direct sunlight and don't let temperatures drop below 60°F (15°C).

POTTING

Repot into the next size up when roots grow out of the bottom of the existing container, ideally in early summer. Use general potting compost.

GROWTH RATE

If given good growing conditions, this plant can grow easily and quickly, reaching 10ft (3m) tall (or long) indoors.

CARE

Keep the soil moist when in growth using lukewarm water and feed monthly with a balanced liquid fertilizer. Water sparingly in winter.

I'll remove toxins

My leaves can help alleviate asthma symptoms by removing formaldehyde from the air and releasing oxygen. Formaldehyde is a toxin that can permeate the atmosphere of your home, especially from processed wood furnishings.

Be mindful of me

My leaves turn lighter green and yellow if I'm hungry. I also like a spritz and a wipe occasionally to keep my leaves dust-free.
