

Love my leaves

It's not just my flowers that will add style to your home; my long, velvety leaves will also bring attractive texture and color. Please be kind to my leaves since they can tear easily—if they are accidentally torn, simply cut off the leaf, as I am quite forgiving and will grow new ones.

Get to know me

My name comes from the Greek word *strepes*, which means “twisted,” and *karpes*, meaning “fruit.” This refers to my long and twisted seed pods, but rather than allow me to use up my energy developing these seeds, pinch them off to encourage more flowers.

Keep me flowering

I can flower for most of the year in ideal conditions. Although I can flower in my natural habitat on the forest floor in South Africa, I still need enough light to photosynthesize, so I'll flower best by a bright window with indirect sunlight. Remove my dead flower stalks in spring or summer.

Let's make babies

In spring or early summer, pick new, healthy leaves from near my center. Cut the leaves with a sharp knife into three or four sections, then insert the leaves into all-purpose compost the right way up, with cut edges in the mix so they can root. Water well, and babies will soon appear at the base of each leaf to be potted up separately.
