

AIR PURIFICATION

The fundamental benefit of plants is that they oxygenize the air. When we breathe in oxygen, our bodies respire to produce carbon dioxide. Plants absorb that carbon dioxide as they photosynthesize and release oxygen, helping the cycle repeat. In addition, plants can dispose of toxins in two different ways.

Removal of pollutants

Many plants absorb toxic chemicals via pores in their leaves. They also humidify the air, which acts to push toxins to the soil to be broken down.
