

WHERE TO POSITION YOUR PLANTS

Where you position your houseplant is perhaps the most important factor in determining its success. Some locations are perfect for certain varieties and hostile to others. And it's not just about light and warmth; there are many other influencing factors that make each spot unique.

Humidity When air around a plant is drier than in its cells, the plant can lose moisture through the pores in its leaves. The bathroom can be an ideal place for plants that like high humidity conditions.

Peace lily (see pp.126–127)

Kalanchoe (see pp.100–101)

Drafts

Plants do not like constant changes in temperature. A drafty window or door position could stress a plant and during winter may kill it off.

Plants for tricky spots For any really difficult positions like dark corners or spots that are either very humid or very dry, try tough, hardy houseplants that are forgiving, such as the Swiss cheese plant.

Swiss cheese plant (see pp.108–109)
