

Vacation solutions

Line your bath or shower with soaked towels and place your plants on top to ensure that they stay watered and well while you're away on vacation.

It's always best to water your plants with rainwater or distilled water if you can, because tap water contains additives such as chlorine, fluoride, and sodium. These are added for human consumption but can cause damage to some sensitive plants, building up on the foliage or in the soil and leading to brown or wilted leaves and slow growth. Set up a rain-harvesting water butt for an eco-friendly water source.

Regular watering is of course essential, especially during the summer, so if you're going on vacation, put the plug in the bath or shower and line the bottom with old towels, adding water until the towels are sodden but not submerged. Then, stand all your houseplants on the towels, leaving them until you return. The wet towels will provide the moisture and humidity the plants need.

“Clustering plants together allows them to create their own microclimate.”

Feeding

Feed your houseplants with liquid fertilizer or slow-release food for indoor plants during spring and summer, depending on their demands. Give plants a rest period between late fall until early spring, with reduced watering and no plant food.

Humidity

Many houseplants—especially those with tropical origins—appreciate a humid environment. Regular misting is a simple and direct way to dampen moisture-loving plants, but for a lighter and more constant source of humidity, place the plant pot on a tray filled with gravel and water. This means that the pot isn't sitting directly in water, but as the moisture in the tray slowly evaporates, it creates a naturally humid environment.

These types of plants often grow better in groups. This is because each one releases water vapor into the air through transpiration, so clustering plants together allows them to share humidity and create their own microclimate.

Add liquid feed to water
