

HOW TO REPOT YOUR HOUSEPLANT

Choose a container that is one or two sizes bigger than the one the plant is currently in, and ensure that the new pot has sufficient drainage holes to prevent the plant from sitting in water. Then follow these simple steps:

1 The day before you repot your houseplant, give it a good water so it's happier and easier to move.

2 Sprinkle gravel on the base of the new pot for drainage; add suitable potting mix on top, leaving room for the plant.

3 Coax out the plant by gently tapping the bottom or squeezing the sides. Loosen the roots a little before planting it in the center of the new pot and packing it down.

4 Add a little more potting mix around the plant, pressing it in until the plant is comfortably secure, then water well, and let it settle into its new home.
