

BIRD'S NEST FERN

Asplenium nidus

This fern evokes the feel of a tropical forest. Its fresh green leaves erupt from the center of the plant and spray upward. It's perfect as a single specimen or in a display with other plants, adding texture and structure.

“Bathe in the indoor forest of my lush foliage.”

Help me thrive

POSITION

A bright spot in indirect sunlight is best, though it will appreciate a bit of morning and/or evening sun. Keep it warm, not below 60°F (15°C).

POTTING

It has a small root system but a big top half, so use a relatively small but heavy clay or ceramic pot for balance. A humus-rich compost is ideal.

GROWTH RATE

Fronds can eventually reach 2ft (60cm) long but are quite slow growing—it can take between 4 and 8 years to reach its ultimate height.

CARE

Likes humidity, so mist regularly and place on a tray of damp moss if possible. Compost should be damp but not wet, with no water sitting on the soil.

I'll clean your air

My large sculptural leaves mean there is more surface area for me to absorb carbon dioxide and convert it into oxygen to expel into the atmosphere, so I'm not only pretty but also a practical addition to your home.
