

SPIDER PLANT

Chlorophytum comosum

This plant is one of the great survivors of the houseplant world. It can tolerate a lot of neglect and bounces back well when remembered. It's been a popular houseplant for decades, bringing bright foliage to empty windowsills with its beautiful arching leaves, which have fresh lime green and white variegation.

“I’m hard to kill and
a great air purifier.”

Help me thrive

POSITION

Likes a bright spot, but avoid direct sunlight as this can burn its leaves. Grows best between 55°F (14°C) and 65°F (18°C) at a constant temperature.

POTTING

Transplant to a larger pot with an all-purpose houseplant compost when you start to see the roots emerge above the soil.

GROWTH RATE

These plants are rapid growers, producing plenty of sprouts. They can grow up to 2ft (60cm) tall and can get to 3¼ft (1m) wide.

CARE

Allow the top of the soil to dry out before watering. Use a liquid houseplant feed every week or two in spring and summer.

I'll remove toxins

I can reduce the risk of exposure to formaldehyde, which might be found in varying levels in wooden-furniture stains, varnishes, and polishes, adhesives, building materials, detergents, and cigarette smoke. I absorb the toxin into my leaves and release oxygen in its place.
