

STRING OF PEARLS

Curio rowleyanus

You will love this remarkable succulent for its easygoing nature and unusual pearl-like foliage. As they grow, the stems form a delicate cascade, which has a restful effect on the mind, much like trickling water. The aromatic flowers will further stimulate your senses.

“I’m so easy to share with the people you love.”

Help me thrive

POSITION

Place in a bright spot out of direct sunlight. Grows best at 64–75°F (18–24°C), but it will tolerate short periods at 50°F (10°C).

POTTING

Use cactus compost or a 50:50 mix of 4mm grit and loam-based compost. Repot in spring in dry compost and water after 2 weeks.

GROWTH RATE

In the right conditions, this plant can grow 8–10in (20–25cm) per year, reaching an ultimate length of 3ft (1m).

CARE

Water every 2 weeks in spring and summer and not at all in fall and winter (though don’t forget to say “hi!”).

Get to know me

My green pearls are an odd type of leaf whose shape reduces evaporation, helping me survive in the desert.

Each “pearl” has a transparent slit that acts as a window, allowing light to flood inside and help power my photosynthesis.

Be mindful of me

Give me an energy boost by adding a high-potash fertilizer to my water two or three times a year. Pull off any old, shriveled leaves and trim back stems in spring, as necessary to keep its size and appearance in check.
