

ARECA PALM

Dypsis lutescens

The first areca palm I owned grew to head height and arms' width. It transformed my student apartment with its glorious arching fronds of light-green foliage and contrasting golden stems.

Don't underestimate the powerful presence of this graceful Madagascar palm—nor its air-purifying ability.

“I will bring structural elegance and clean air.”

Help me thrive

POSITION

Grows well in a bright, light room out of direct sunlight. Don't let the temperature drop below 60°F (15°C), as this may discolor the leaves.

POTTING

Repot every 3 years in spring into the next pot size up. Use a free-draining potting mix, since these plants hate overly damp conditions.

GROWTH RATE

Areca palms usually grow up to 10in (25cm) a year and can ultimately reach a height of 7ft (2.1m).

CARE

When in growth, water to keep the soil moist but not wet, and give a monthly balanced liquid feed. Water infrequently during winter.

I'll clean your air

I help with healthy breathing functions because, through photosynthesis, my leaves are very effective at extracting carbon dioxide and can assist with filtering levels of carbon monoxide from the air and replacing them with oxygen.

If I bloom, my bright yellow sprays appear just under my leaves

I'm quite a looker

I'm also known as the “butterfly palm” because my structure resembles the shape of a butterfly's wings. The strong stems at my base support my tropical fronds, which arch upward, reach a peak, and then arch gracefully downward like a fountain.
