

RUBBER PLANT

Ficus elastica

Royalty of the houseplant world, this classic plant shines out from all others with its iconic large emerald-green leaves and treelike habit. A rubber plant is certain to freshen up a tired spot, transforming it into a space of vibrant interest. It's one of the world's most popular indoor plants and deservedly so.

“I will lift the gloom
from dull corners.”

Help me thrive

POSITION

Grows best in light shade, at 60–75°F (15–24°C); do not let the temperature dip below 55°F (13°C), but keep away from radiators.

GROWTH RATE

Can eventually grow to ceiling height, so it may need a cane to support it or a wall to lean on. Prune in late winter to keep it in check.

POTTING

Repot annually during the first 5 years, then every 2 years, into a container one or two sizes bigger and using well-draining potting compost.

CARE

Feed every 2 weeks from spring to early fall with a diluted liquid fertilizer. Water little and often, and never let it sit in water.

I'll remove toxins

My leaves remove carbon dioxide and may also help remove airborne bacteria and mold spores. I can also help remove formaldehyde and benzene from the air, which are emitted by paint, cosmetics, glues, and detergents and can cause headaches, drowsiness, and irritate eye, nose, and throat.

Be mindful of me

I use the dark green pigment in my leaves to absorb the light that gives me energy to thrive, so please keep my leaves free of dust by wiping my foliage clean every month so I can stay healthy.
