

AMARYLLIS

Hippeastrum cultivars

Everyone should grow at least one amaryllis in their lifetime—they are truly dynamic. Growing this indoor bulb instills a real sense of pride because of the speed of its growth and the magnificence of its flowers. There are so many different varieties and colors to choose from—they are a plant collector's dream.

“Take pride in cultivating my magnificent blooms.”

Help me thrive

POSITION

Will grow well on a windowsill in bright filtered or full light and needs a temperature of at least 54°F (12°C).

POTTING

Repot in the fall into a pot 2in (5cm) wider than the bulb, with the bulb half out of the compost—but only every 3–5 years to minimize root disturbance.

GROWTH RATE

Can reach 1–2ft (30–60cm) tall and 1ft (30cm) wide. They tend to bloom in winter or spring, 6–10 weeks after the bulb has been planted.

CARE

Water when the top of the soil feels dry and feed every 10 days when leaves start to appear. Stop watering in early fall and remove old leaves.

I'll make you proud

I am a marvelous plant for promoting mental well-being since I am easy to grow and unlikely to fail, giving you a great sense of pride and achievement. You won't have to wait long for your reward, as my spectacular blooms are quick to appear.

Keep me going

After I have flowered in winter or spring, please remove the flower stalk to within ½in (2cm) of the top of the bulb. Begin feeding me every two weeks with liquid fertilizer once I start shooting new growth. This will help me refill my bulb with energy.

I don't like it too wet

Like all bulbs, if I sit in soggy soil, it can lead to rotting, so please don't leave me in a pot cover or saucer with a pool of water in it. During my dormant period when my leaves are cut, you can leave me to rest with no water at all.
