

8 The blades of the waterwheel have to fit inside the frame and be able to turn around easily. To achieve this, hold the waterwheel next to the frame and trim the blades to the right length.

9 Remove the bottle cap and pierce a hole through it. You have to push hard, so secure the cap in some adhesive putty—and watch your fingers! Screw the cap back onto the wheel.

10 Cut the straw so you have a straight part, about 2in (5cm) long. Carefully snip one end into four sections. Fold the sections down at right angles to the straw.

You can snip the sharp end of the skewer once it's through the bottle cap.

Electrical tape holds the straw firmly on the skewer.

Check that the wheel turns freely.

11 Slide the skewer through the straw and tape the straw onto it, about 1½in (3cm) from the end. Then push the wooden skewer through the hole in the bottle cap.

12 Pack adhesive putty into the bottle cap to secure the cut sections at the end of the straw. Now try turning the skewer with your fingers. The waterwheel should turn, too!

13 Push one side of the skewer through the hole in the base of the bottle, resting the other side in the open notch. The bottle cap should not touch the side of the frame.
