

LAVA FLOW

Volcanoes form where molten rock underground, called magma, escapes to the surface. When it emerges from underground, magma is called lava. Bubbles of gas make the lava foamy, just like the lava you'll produce in this experiment. The cone of a real volcano is made of lava that has solidified, and it grows bigger with every eruption.

A chemical reaction inside your volcano produces the bubbling lava.

The cone of your volcano is made of paper-mache.
