

HOW TO MAKE AN ERUPTING VOLCANO

This gets messy, so work outdoors if you can. Your volcano is built from paper-mache, made from newspaper dunked in a runny paste. The spectacular eruption is produced by two very ordinary household products: vinegar and baking soda. If you clean and dry the volcano with paper towels after an eruption, you can use it again and again.

drying time

Difficulty

Medium

1 Using your scissors, carefully cut off the top of the bottle. This is so you can easily add the ingredients later on—and for it to come out again in the form of an eruption. This will be the center of the volcano, with the bottle's mouth as the crater.

2 Using several pieces of packing tape, stick the bottle to the middle of your large piece of cardboard. When everything is secure, you're ready to start building up the volcano's cone around the bottle.
